

Does feedback change minds—or improve judgment?

ROUND 2 → ROUND 3

ILLUSTRATIVE DESIGN · NO MEASURED FEEDBACK EFFECT

a How does the shape of opinion change?

Round 2

Round 3

20 hypothetical participants per example · identical claims and scales · lines connect discrete rating proportions

b Does disagreement decrease?

No feedback

Peer feedback

Fine line = one consultation · bold line = mean · 100 simulated pairs per arm

c Does accuracy improve?

Peer feedback · factual tasks

Same feedback cases as b · pp = percentage points

Figure 2 | Distinguishing opinion change, convergence and factual improvement.

a, Three constructed examples show round-two and round-three rating distributions for 20 hypothetical participants per example. Lines join discrete proportions and are not continuous belief densities. These examples illustrate possible patterns; they were not selected from the consultations in b-c. b, Each fine line connects the same simulated consultation in rounds two and three; descending lines indicate reduced disagreement. Bold lines and labelled endpoints show arithmetic means, not uncertainty intervals. Feedback and no-feedback panels share identical scales. These are consultation-level trajectories, not individual participant ratings. Scores are reused from the existing illustrative deliberation dataset (100 cases per arm); they were constructed directly, not calculated from recorded ballots. c, The same simulated feedback cases show changes in disagreement and factual accuracy. Convergence can accompany improvement or worsening; accuracy is meaningful only for questions with assessable answers. Contours in c enclose 50% and 90% of each estimated density and are descriptive, not confidence intervals. For a real experiment, randomise consultations to feedback or no feedback, retain identical claims and scales, prespecify the disagreement measure, and compare matched participants while reporting attrition. These simulations demonstrate the figure design and do not establish a causal feedback effect.
