

Opinion and confidence can move differently

Round 2 → Round 3 / Four authored consultations · six fictional participants each

Paired changes in opinion (a) and confidence (b) for the first two claims in each consultation. Each column follows the same six fictional participants; rows share participants and claims. Confidence is certainty in one’s own rating, not factual accuracy. Bold lines are descriptive medians; no uncertainty intervals or feedback effects are inferred. All responses and changes were authored for the completed platform simulations, not observed in a human study. The downloadable source table includes exact claim wording and all four claims per consultation. No participants or trajectories have been added for appearance.
