

The movement behind the average

ILLUSTRATIVE DESIGN / 100 independently simulated participants per panel · 800 in total

Eight hypothetical patterns demonstrate how changes in opinion and self-reported confidence can differ. Each thin line links one simulated participant across rounds; darker areas arise where paths overlap. Opinion and confidence use separate five-category scales. Small point offsets reveal overlap only; source ratings are integers. Bold trends are arithmetic means of category codes 1–5, not accuracy measures or confidence intervals. All movements are constructed to illustrate the design. These are not additional platform submissions, resampled pilot participants, or evidence of a feedback effect.
